Smokeless tobacco cessation in primary care clinics: A cluster randomized control trial in Odisha, India

Multi Principal Investigator – Ritesh Mistry, PhD (Contact PI)

Multi Principal Investigator – Jasjit S Ahluwalia, MD, MPH

This study will leverage the primary care system to conduct a cluster randomized trial in 20 HWCs in urban and rural Odisha among adult patients who exclusively use SLT (n=960) to test the efficacy of a hybrid motivational interviewing (MI) and 5As (Ask, Advise, Assess, Assist, Arrange) SLT cessation program combined with nicotine replacement therapy compared to usual care. The program is designed to be integrated with the current clinic systems, be culturally tailored, and use an MI-based 5As tobacco cessation and counseling model. Patients in the intervention group will receive directive advice to quit from a physician, a brief MI-based discussion about SLT cessation with a counselor, a 3-month course of the nicotine patch, and CHW home-based counseling.

Principal Investigator – Debra Bernat, PhD

Co-Investigator – Jasjit S Ahluwalia, MD

Public housing residents who smoke, and are interested to quit, will be randomized to either the intervention or control group. The intervention group will receive 8 weeks of cessation counseling provided by the trained peer leaders and transdermal nicotine patches. Peer leaders will be DCHA residents who receive formal training in cessation and are former smokers. The control group will receive information on quitting smoking and the District of Columbia Quitline. During the trial, both groups will complete assessments at baseline, 8 weeks, 2-months, and 6-months.

The objective of this application is to provide much needed data to the FDA to guide regulatory action on EC flavoring. Menthol smokers (n=800), stratified by race and gender, who are interested in switching to EC, will be randomized 1:1 into a 12-week open label, non-inferiority RCT comparing menthol EC versus tobacco EC. Follow-up will continue through week 26. The central hypothesis is that tobacco EC are not inferior to menthol EC at facilitating a switch to EC in menthol cigarette smokers.

By conducting a head-to-head AA-White pharmacotherapy study, the objective of this application is to examine varenicline for smoking cessation among AA and White smokers, and to better understand racial differences in quitting. We will conduct a prospective cohort intervention study, stratified on race, age (< 40, > 40), and gender, in which 448 participants (224 AA, 224 White) will receive 3 months of varenicline. The central hypothesis is that AAs will demonstrate lower 7-day abstinence from smoking at month 6 than Whites. The long-term goal of the University of Minnesota's Center is to create an informed, empowered and activated community that collaborates with researchers and practitioners to improve the health of their populations. The Center will be comprised of four Cores: Administrative, Research, Research Training and Education, and Community Engagement and Outreach, and two research projects. The research project on minority health is a randomized intervention trial that will employ Community Health Workers and state-of-the-art biomarker feedback to encourage cessation and home smoking restriction among African American families. Our Center aims are to: 1) Promote HD and MH research at UMN and our partners. 2) Strengthen our community partnerships to be leveraged to improve the health of minorities and new immigrants. 3) Integrate UMN's MH and HD resources into an easy-to-navigate, seamless infrastructure that fosters connections and communication across communities, academic disciplines, and institutional units. 4) Recruit, train and mentor students, fellows, faculty and future research leaders who are from underrepresented populations and/or wishing to conduct work in MH and HD.

Principal Investigator - Janet Thomas, PhD, MD, MPH

Co-PI - Jasjit S. Ahluwalia, M.D., M.P.H., M.S.

The primary aim of this study is to evaluate the efficacy of two distinct theory-based approaches to enhance maintenance of abstinence among campus Quit & Win participants. Specifically, we will test the ability of 1) extended financial incentives and/or 2) Motivational Relapse Prevention counseling to increase rates of smoking cessation following the standard one-month contest. Participant evaluations will occur at baseline, and approximately 1, 3, and 6 months after study enrollment. The primary outcome is biochemically validated 30-day point prevalence abstinence at the 6 month evaluation.
